Some of the elements that we pass to this function is an array of objects, which might look like this: { name : 'John', text : 'I like bananas' } So, when I scroll, I may have to print out these data somewhere, and I thought that the best way to do it would be to use an object that will act as the controller for our function, and the function itself will look like this: var onScroll = function(

In my app I have several migrations that require a db:migrate task, and they all run at once. If the state of

the db isn't as it was when the migration was written, it's quite likely that one of them will find an error. Is it safe to run the different migrations in a single rails app? EDIT: Is it safe for me to run all my migrations at once on my production server? I'm asking this because I noticed that some of them are executed twice on production. A: You're asking the right questions, which is why it's ok to try it. On Rubygems, you may notice that the rake 'install:migrate' task is not listed in the doc's, while the 'install:all' is. The 'install:all' is probably redundant but if you do 'bundle exec rake install:migrate', it executes every single migration rather than the 'migrated' ones. The 'bundle exec rake' part is telling 'bundle' to execute every command within that file. Not to be confused with 'bundle exec rails server' which will specifically execute the server up command. You said Is it safe for me to run all my migrations at once on my production server? I'm asking this because I noticed that some of them are executed twice on production. It's not the case here.
