I have widget instance of Widget class (like GameWidget, MessagingWidget, etc), and I need to update components such as Text objects in them. What are the differences between updating them like this: GameWidget.instance.text = new Text("This is a text"); GameWidget.instance.text.text = "New text"; GameWidget.instance.update() And this? GameWidget.update(GameWidget.text); GameWidget.text = new Text("This is a text"); GameWidget.text.text = "New text"; GameWidget.update() Question is: is there any difference in terms of their accessibility or safety? As far as I understand I have to call update method in the second way in order to make the modification effective, but I have no idea what could be the impact of this to widgets instance (on widget manager, accessibility, browser component safety, etc). Could someone explain me? A: The difference is that the first way of doing this is not a method call, so it's evaluated when a GameWidget.update() is called, and the second way is directly in the GameWidget instance where the call would be effectively evaluating a method immediately. 3ef4e8ef8d
