It told me I was going to uninstall a component that "held the registry." I said, "OK, that's fine." . The uninstaller then proceeded to uninstall everything on my system. . I was left with a completely blank hard drive. . I tried to reinstall Windows, but it would just show a black screen at the windows splash screen. . To be fair, it's not entirely my fault. My computer was infected. I was only able to run the clean install because the infection was detected as ransomware. . When I told the technician that my computer was infected with ransomware, he told me that it would be too late to do a clean install. . I asked if there was a way to completely remove it so that I can start from scratch. . I was told that it would take a while and that I should just reinstall Windows. . . I found that if I used the killswitch.exe application on the infected system, and then downloaded the Malwarebytes Anti-Malware utility, it would detect the ransomware infection and remove it. . I also tried to manually delete it, but I did not have any luck. . This is a very difficult situation. I don't want to keep the malware on my system, but I cannot reinstall Windows. It will not load. . The technician told me that if I let it install, it would try to install the minidrive software on my computer. . I don't know about you, but I find the minidrive software extremely irritating. It never loads, and it slows down my computer. . I understand that if I let it install, I will have to reinstall Windows. . Can anyone help? If you have a solution to delete the ransomware without reinstalling my computer, then I would greatly appreciate it. I hope this helps someone else out. . A: Since you are using Windows 10, you will want
