Change `and(spandata(1),spandata(1) == 'A')` to `and(spandata(1),spandata(1) == 'A' and spandata(2) != 'B')`. Technical development of the classical phase II trial design. The fundamental rule of classical phase II trials is to assess the efficacy and toxicity of a new therapeutic modality in a small cohort of patients. The aim of this article is to describe the evolution of this study design, outlining the limitations and advantages of the classical phase II study design. The patient population should be well defined and the efficacy and toxicity profiles of the novel agent need to be well understood. The drug, disease, patients, and route of administration used in the trial should be the same as those in the definitive phase III trials. The timing of the assessments and the endpoint used are determined by the primary endpoint of the definitive trial. Safety is the key to phase II trials, but has been minimized to the extent possible with modern, biologically based cytotoxic therapy. The distinction between toxicities and real therapeutic failures is a key aspect of the classical phase II study design. Major toxicity or failure is defined as a new treatment failing to achieve the primary endpoint. There are many differences in the design of classical phase II and phase III trials. These can be considered from an efficacy perspective, from a statistical perspective, and from the practical perspective of the patient and their doctor. Joint Project The Joint Project is a departmental educational project at the Beijing Normal University, jointly sponsored by the Department of Economics and the Department of Business. It is modeled on the MIT Sloan School of Management's Joint MBA Program and runs with 2d92ce491b
